### 0.1 Hermitian (self-adjoint) matrices

A matrix where  $M = M^*$

For matrices over the real numbers, these are the same as symmetric matrices.

#### 0.1.1 Sesquilinear forms on Hermitian matrices

$$\phi(u, v) = u^* M v$$

$$(u^* M v)^* = v^* M^* u = v^* M u$$

$$\phi(u, v) = \overline{\phi(v, u)}$$

#### 0.1.2 The forms on the same vector are always real

$$(v^* M v)^* = v^* M^* v = v^* M v$$

So we have:

$$(v^* M v)^* = v^* M v$$

Which is only satisfied for reals.

#### 0.1.3 If $A$ and $B$ are Hermitian

If  $A$  and  $B$  are Hermitian,  $AB$  is Hermitian if and only if  $AB$  commutes.

$$(AB)^* = B^* A^* = BA$$

If it commutes then

$$(AB)^* = AB$$

#### 0.1.4 Real eigenvalues

Hermitian matrices have real eigenvalues.

$$Hv = \lambda v$$

$$v^* H v = \lambda v^* v$$

$$v^* H v = \lambda$$

#### 0.1.5 Skew-Hermitian matrices

These are also known as anti-Hermitian matrices.

$$M^* = -M$$

#### 0.1.6 If eigenvalues are different, eigenvectors are orthogonal
