## 1 Measure space

### 1.1 Defining measure spaces

#### 1.1.1 Measure space

In a metric space, the structure was defining a value for each two elements of the set.

In a measure space, the structure defines a value of subsets of the set.

A measure space includes the set  $X$ , subsets of the set,  $\Sigma$ , and a function  $\mu$  which maps from  $\Sigma$  to  $\mathbb{R}$ .

##### 1.1.1.1 Sigma algebra

Requirement for  $\Sigma$ .

#### 1.1.2 Axioms for measures

##### 1.1.2.1 Measures are non-negative

$$\forall E \in \Sigma : \mu(E) \geq 0$$

##### 1.1.2.2 The measure for the null set is 0.

$$\mu(\emptyset) = 0$$

##### 1.1.2.3 Disjoint sets are additive

$$\mu(\bigcup_{k=1}^{\infty} E_k) = \sum \mu(E_k)$$

Where all elements  $E_k$  are disjoint. That is, they have no elements in common.

## **1.2 Examples of measure spaces**

### **1.2.1 The counting measure**

$$\mu(E)$$

This provides the number of elements in  $E$ .

### **1.2.2 The probability measure**

This is discussed in more detail in Statistics.
