## 0.1 Fundamental Theorem of Arithmetic

### 0.1.1 Statement

Each natural number is a prime or unique product of primes.

### 0.1.2 Proof: existence of each number as a product of primes

If  $n$  is prime, no more is needed.

If  $n$  is not prime, then  $n = ab$ ,  $a, b \in \mathbb{N}$ .

If  $a$  and  $b$  are prime, this is complete. Otherwise we can iterate to find:

$$n = \prod_{i=1} p_i$$

### 0.1.3 Proof: this product of primes is unique

Consider two different series of primes for the same number:

$$s = \prod_{i=1}^n p_i = \prod_{i=1}^m q_i$$

We need to show that  $n = m$  and  $p = q$ .

We know that  $p_i$  divides  $s$ . We also know that through Euclid's lemma that if a prime number divides a non-prime number, then it must also divide one of its components. As a result  $p_i$  must divide one of  $q$ .

But as all of  $q$  are prime then  $p_i = q_j$ .

We can repeat this process to to show that  $p = q$  and therefore  $n = m$ .
